

ABSTRACT

The invention is to provide a method for reproducing a plurality of audio/video files from an optical information recording medium in accordance with at least one schedule file. In a preferred embodiment of the invention, seven schedule files, which each corresponds to one of seven days of a week, are created. The seven schedule files and the audio/video files are recorded onto the optical information recording medium. When a user want to reproduce the audio/video files from the optical information recording medium, according to a current day of the week, the schedule file corresponding to the current day is retrieved from the optical information recoding medium. Then, the audio/video files are reproduced from the optical information recording medium according to the retrieved schedule file.
